Youth participation in civil society and political life in Rajasthan

Youth participation in civil society and political life is increasingly recognised as an important development objective. The opportunities for participation that young people experience in their communities may influence their development and the kind of transitions they make to adulthood. For example, evidence that comes largely from developed countries indicates that youth who participate in community activities or are connected to their communities are less likely than others to engage in risk-taking behaviours. Moreover, behaviours and attitudes relating to community participation that individuals adopt as young people predict their lifelong civic affiliations and perspectives.^a

In India, the National Youth Policy 2003 has underscored the role of India's youth in political decision-making, and has argued for greater representation of youth in appropriate bodies as well as more extensive youth participation in the design and implementation of programmes.^b Indeed, there is a recognition that today's youth, who have better access to skills and information than those of earlier generations, can play an important role in influencing political processes and the socio-economic development of the country. However, there is very little evidence of the extent to which Indian youth participate in civil society and political life.

This policy brief documents the participation of youth in Rajasthan in civil society, the extent to which they uphold secular attitudes and their perceptions about and participation in political processes.

The study

Data are drawn from the *Youth in India: Situation and Needs* study, a sub-nationally representative study undertaken for the first time in India of key transitions experienced by young people in six states of India, including Rajasthan. The study included a representative

survey of youth in both rural and urban settings. Respondents included unmarried women and men and married women aged 15–24 and, in view of the paucity of married men in these ages, married men aged 15–29.

In Rajasthan, the survey was conducted in 2007. A total of 10,002 married and unmarried young men and women were interviewed in the survey. These included 1,886 married young men, 2,129 unmarried young men, 2,603 married young women and 3,384 unmarried young women. This brief is based on data obtained from 2,974 young men and 5,987 young women aged 15–24.

To what extent do young people participate in civil society?

Participation in civil society, as measured by participation in community-led activities and membership in an organised group, was limited among youth, particularly among young women. Specifically, 23% of young men compared to 13% of young women reported that they had participated in any community-led programmes such as cleanliness drives, health promotion activities, and celebration of festivals and national days. Even fewer—just 2% of young men and 3% of young women—reported membership in organised groups such as self-help groups, and sports and social clubs. In total, 24% of young men and 15% of young women reported participation in civil society.

Findings indicate that participation in civil society was more likely to be reported by better than less educated youth, and differences were particularly wide among young men. For example, 15% of young men with less than 9 years of schooling participated in civil society compared to 33% of those with at least 9 years of schooling. The corresponding percentages among young women were 9 and 32.

Findings also show that more unmarried than married youth reported participation in civil society. More than one-quarter (27%) of unmarried young men compared to one-fifth of the married (19%) reported such participation. Among young women, differences were even wider: 26% of the unmarried compared to 9% of the married had participated in civil society.

In contrast, findings show that rural–urban differences in civil society participation were narrow. Indeed, young men in rural areas about as likely as their urban counterparts to have participated in civil society; among young women, somewhat more of those in urban than rural areas had participated in civil society (19% versus 14%).

Do young people uphold secular attitudes?

In order to gauge the extent to which youth uphold secular attitudes, two issues were addressed. The first assessed young people’s attitude to social interaction with individuals of different castes and religions. Specifically, youth were asked whether they would mix freely and eat together with a person from a

different caste or religion, and would talk to someone who had an inter-caste marriage. The second issue assessed young people’s tolerance towards someone who showed disrespect to their religion. Specifically, youth were asked whether or not they considered it acceptable to punish someone who showed disrespect to their religion.

Findings show that almost all young men (94–95%) and fewer young women (80–86%) expressed secular attitudes about mixing freely with individuals of different castes and religions. However, considerably fewer reported that they would eat together with a person from a different caste or religion or talk to someone who had an inter-caste marriage: 71% and 47%, respectively, of young men, and 55% and 35%, respectively, of young women.

Few youth reported affirmatively to all four items—just 35% of young men and 14% of young women. Better educated young men were just slightly more likely than their less educated counterparts to report affirmatively to all four items; better educated young

women, however, were more likely than the less educated to report so (21% and 12%, respectively). Secular attitudes in all four situations were slightly more likely to be reported by unmarried young men and women than by their married counterparts, and by rural young men and women as compared to their urban counterparts.

In addition, just under one-fifth of young men (18%) and one-third of young women (30%) considered it unacceptable to retaliate, through punitive action, against someone who showed disrespect to their religion.

What do young people think about the commitment of political parties and fairness of the electoral process?

Considerable proportions of youth reported disillusionment with the commitment of political parties to work for change at the community level. Indeed, 62% of young men and 52% of young women believed that improvement in their village (rural youth) or neighbourhood (urban youth) was unlikely,

no matter which political party governed the state. Another 9–10% reported that they had no opinion about the commitment of political parties.

It is notable, however, that the majority of youth—86% of young men and 81% of young women—perceived that the electoral process was fair and one could vote without fear or pressure. Even so, one-tenth of young men and women (10–11%) felt that one could not vote freely.

Do young people exercise their voting rights?

Findings suggest that more young men than women exercise their voting rights. Of those who were eligible to vote in the last election preceding the interview (aged 20 years and above at the time of the interview), 80% of young men and just 65% of young women had cast their vote. Rural youth were about as likely to have voted in the last election as their urban counterparts. Similarly, better educated youth were about as likely to have voted as

their less educated counterparts (those with less than 9 years of education). Marital status differences suggest, however, that the married were more likely than the unmarried to have voted in the last election: 84% compared to 74% among married and unmarried young men, respectively; and 66% and 53%, respectively, among young women.

Programme recommendations

Findings call for actions to promote youth participation, particularly the participation of young women, in civil society and political life.

Promote youth participation in civil society

Findings that opportunities to engage in civil society remain limited for many youth call for programmes at the school, college and community levels—through national service programmes, sports and other non-formal mechanisms that encourage civic participation. Special attention must be paid to developing community-level programmes for young women, large proportions of whom are out of school.

Build secular attitudes

Evidence suggests that youth in Rajasthan did not uniformly express secular attitudes. This finding underscores the need to encourage the development of secular attitudes from a young age, incorporate value building components that reinforce secular attitudes and stress peaceful resolution of conflict in the school curriculum as well as in programmes directed at young people more generally.

Address young people's disillusionment with the commitment of political parties

Findings suggest that a large majority of youth are disillusioned with the commitment of political parties to work for change at the community level. The political system in the state needs to make special efforts to address the concerns of youth and encourage youth participation in the political processes in more meaningful ways.

Encourage young women to exercise their voting rights

More young men than women exercised their right to vote, highlighting the need to focus on encouraging young women to vote. Special efforts must be made to identify and address the obstacles that young women face in exercising their right to vote.
