Transition to work roles among youth in Rajasthan

“Achieving full and productive employment and decent work for all, including women and young people” is one of the targets articulated under the Millennium Development Goals and ratified by countries worldwide, including India.^a Also, reflecting India’s commitment to meeting the employment needs of its citizens, new policy and programmatic initiatives have been launched in the country in recent years. For example, the Draft National Employment Policy aims to achieve “remunerative and decent employment for all women and men in the labour force”;^b and the recently approved National Policy on Skill Development (2009) aims to empower individuals, especially youth and women, through improved skills, knowledge and qualifications to gain access to employment in an increasingly competitive global market.^c It is important, in this context, to take stock of the extent to which youth are equipped to make a successful transition to work roles and the extent to which they are indeed making that transition; this policy brief aims to do so for the state of Rajasthan. Specifically, are youth in the state transitioning into work roles at appropriate ages and with adequate skills? Are opportunities available that enable youth to overcome skill mismatches through vocational skills training? Are youth succeeding in finding productive employment and becoming integrated into the labour market?

Looking at the current employment situation of youth in Rajasthan, this policy brief argues that significant investment in terms of appropriate policies and programmes are required to improve the employability of youth in the state and thereby enable them to find full and productive employment.

The study

Data are drawn from the *Youth in India: Situation and Needs* study, a sub-nationally representative study undertaken for the first

time in India of key transitions experienced by young people in six states of India, including Rajasthan. The study included a representative survey of youth in both rural and urban settings. Respondents included unmarried women and men and married women aged 15–24 and, in view of the paucity of married men in these ages, married men aged 15–29.

In Rajasthan, the survey was conducted in 2007. A total of 10,002 married and unmarried young men and women were interviewed in the survey. These included 1,886 married young men, 2,129 unmarried young men, 2,603 married young women and 3,384 unmarried young women. This brief is based on data obtained from 2,974 young men and 5,987 young women aged 15–24.

The majority of youth were poorly equipped for employment

Findings from the Youth Study indicate that the majority of youth in the state were poorly equipped for employment for which there is a market demand. Most youth were neither adequately educated nor equipped with vocational skills.

Few had completed secondary education

Fewer than two in five young men (38%) and one in five young women (18%) had completed secondary education, increasingly a prerequisite to participate in the labour market in the context of globalisation.^{d,e} Indeed, as many as one in ten young men (10%) and two-fifths of young women (38%) had never been to school at all in the state.

Few had acquired vocational skills

A number of vocational training programmes are available to youth through government, non-government and private organisations. However, findings indicate that just 12% of young men and 22% of young women had ever attended a vocational training programme.

Percentage of youth who had ever attended a vocational training programme and who were interested in participating in such programmes

Moreover, findings show that the kind of training received varied by the sex of the respondent. Most young women who had received vocational training had typically acquired traditional skills. For example, 70% reported training in tailoring and 36% in handicrafts, painting or embroidery, compared to just 13% who reported training in computer skills. Young men were far less likely to report training in traditional skills (just 2% and 6% reported training in tailoring and crafts, for example). Indeed, among young men, leading training programmes reported included computer skills (48%), auto mechanics or electrical work (20%), driving (12%) and English language, typing or shorthand (8%).

Findings also show that large proportions of youth—46% of young men and 63% of young women—were interested in acquiring vocational skills. While young men's preferences were focused on computer training, auto mechanics or electrical work, English language, typing or shorthand, and driving, the majority of young women continued to opt for relatively traditional vocational skills, indicating a considerable disconnect between young women's preferences and market needs.

Transition to work roles was not easy or successful for many

Work profiles suggest that three in five young men (48% of the unmarried and 93% of the married) and half of young women (37% and 58%, respectively) had been engaged in paid or unpaid work at some point in the 12 months preceding the interview. Findings, however,

highlight that the transition to work roles is fraught with challenges.

Sizeable numbers transitioned to work roles at young ages

Despite the global recognition that entry into the labour market at young ages competes with young people's schooling opportunities and experiences directly or indirectly, and compromises their productive potential and health,^f and despite significant policy and programme attention to the prevention of early entry into the labour market in India,^g findings indicate that sizeable proportions of youth had transitioned to work roles at young ages. One-fifth (22%) of young men and one-third (36%) of young women reported that they had initiated either paid or unpaid work as children or young adolescents, that is, before age 15. Rural youth were more likely than their urban counterparts to so report. Indeed, rural young women were three times as likely as urban young women to have transitioned to work roles at young ages.

Percentage of youth who had initiated work in childhood or early adolescence (before age 15)

POLICY BRIEF Transition to work roles among youth in Rajasthan

Many young women could not find full time employment

Findings indicate that among those who had engaged in paid work in the 12 months preceding the interview, many young women could not find full time employment. For example, almost two in five young women (37%) had worked for less than six months. Moreover, those in rural areas were far more disadvantaged; 41% of rural young women compared to 23% of their urban counterparts had worked for less than six months. In contrast, the overwhelming majority of young men (90%) had worked for six or more months, and rural-urban differences were narrow among them.

Young men were largely engaged in unskilled non-agricultural activities, young women in agricultural labour

The majority of youth engaged in remunerated work in the 12 months preceding the interview reported traditional activities; however, leading activities in which they engaged was quite different for young men and women. Almost half of young men were engaged in unskilled non-agricultural activities (45%), compared to one-quarter of young women (26%). In contrast, the leading occupation among working young women was agricultural labour (36%), an occupation reported by just 5% of working young men. Fewer young men and women (25–28%) were engaged in skilled

non-agricultural activities and just 4–9% of both young men and women were employed in administrative, executive, managerial or clerical occupations.

Considerable proportions of educated young people were unemployed

Although unemployment¹ rates were low among young people (just 6% among both young men and women) in the state, better educated youth were more likely than others to report unemployment, possibly because of the disconnect between youth skills and market needs. Among young men, for example, unemployment rate increased from 2% among those with no formal education to 16% among those who had completed Class 12. Among young women, the rate increased from 2% among those with no formal education to 14% among those who had completed 8–11 years of schooling and 32% among those who had completed Class 12. These findings suggest that the paucity of opportunities limits the ability of even better qualified youth—young women in particular—to obtain employment.

Many young women were neither in school nor working

Findings suggest that large proportions of young men and women were either in school or working at the time of the interview and a few were both working and studying. However,

Unemployment rate among youth, according to selected characteristics

Economic activity and schooling status among youth

¹ To measure unemployment rates among respondents, the Youth Study assessed (a) whether youth had worked in the 12 months preceding the interview and if so, the number of months worked; and (b) whether youth were seeking work and if so, the number of months during which they had been searching for work.

findings also show that the labour potential of young women was considerably under-utilised. For example, one-third of young women (35%) were neither in school nor working, compared to just 3% of young men.

Programme recommendations

Findings indicate that several challenges remain in absorbing an increasingly youthful labour force and thereby harnessing the state's demographic dividend. A number of policies and programmes are needed to overcome these challenges.

Increase investment in education

Enhancing employability of youth would depend to a considerable extent on improvements in young people's educational attainment. Multiple activities are needed to achieve improvement in educational attainment. Efforts must be made, for example, to address the economic pressures that may discourage parents from enrolling or retaining their children in school in favour of work. Conditional grants and targeted subsidies that encourage schooling, and particularly school completion among disadvantaged groups also need to be considered. At the same time, activities are needed that are directed at parents that promote positive attitudes towards education and school completion, raise parents' aspirations for the education of their children and encourage greater parental involvement in their children's education.

Activities must also address school-level barriers, notably, poor infrastructure and quality of education. There is a need to incorporate livelihood skills building models within the school setting and provide opportunities for those in school to gain market-driven job skills that will expand the aspirations of youth regarding their education and careers. Moreover, investments in improving the quality of the schooling experience are needed that focus on providing better training of teachers and ensuring greater accountability among teachers.

Large numbers of youth have been left behind. There is a need to offer these youth a second chance at education, by way of evening schools and linking them with open schools.

Enable youth to acquire vocational skills

Findings have suggested that while vocational training programmes do exist, gaining access to these programmes is a significant obstacle for both young men and women; among those who obtained training, moreover, young women were particularly unlikely to obtain training in skills linked with market demands. Formal mechanisms must be developed, therefore, that enable youth to access available training opportunities. At the same time, opportunities must be provided to youth that enable them to acquire skills for which there is an established demand, and that link eligible youth to market opportunities. These efforts need to promote self-employment and entrepreneurship through various livelihood schemes, for example, providing soft loans to youth to enable them to set up their own business enterprises.

Ensure that existing programmes aimed at job creation reach youth

While several programmes aimed at job creation are currently underway, findings show that considerable proportions of educated youth were unemployed at the time of interview and among those who were engaged in work for remuneration, many young women were not able to find full time employment. Clearly, available programmes have failed to reach youth, notably young women, and are not equipped to encompass the needs of the educated. Clearly, efforts are needed to ensure that existing programmes aimed at job creations do indeed reach different groups of youth and that they target, in particular, young women.
