The Population Council is an international, nonprofit, nongovernmental institution that seeks to improve the well-being and reproductive health of current and future generations around the world and to help achieve a humane, equitable, and sustainable balance between people and resources. The Council conducts biomedical, social science, and public health research and helps build research capacities in developing countries. Established in 1952, the Council is governed by an international board of trustees. Its New York headquarters supports a global network of regional and country offices.

Foreword

The Population Council initiated its work on adolescents in earnest in the mid-1990s. At that time, those advocating greater attention to adolescent issues were concerned about adolescent fertility—particularly fertility outside of marriage—and, responding to the experiences of Western countries, about adolescent “risk-taking” behavior. As an international scientific organization with its mandate centered around the needs of developing countries, the Population Council sought a more nuanced and context-specific understanding of the opportunities and problems confronting adolescents in the developing world.

As a first step, the Council published a book titled *The Uncharted Passage: Girls’ Adolescence in the Developing World* (Mensch, Bruce, and Greene, 1998). In working with our colleagues inside and outside of the Council, at national and international levels, it became clear that information on adolescents, and the way data are organized, were limiting our ability to understand the diversity of their experiences or to develop programs to address that diversity. Even the words used to describe the 10-19-year-old age group (in English) presented an obstacle. Terms such as youth, adolescents, young people, and teenagers are gender-free. An age group spanning a decade was singularly inappropriate given the rapidity of transitions in this period; even five-year cohorts (10-14 and 15-19) are arguably unreasonably large.

While recognizing these limitations, we nonetheless saw the Demographic and Health Survey results as extremely useful to those seeking to understand and plan for adolescents, provided the data were organized with full understanding of their strengths and weaknesses. In the absence of data, many adolescent policies were implicitly based on the premise that the lives of adolescents in developing countries were like those of adolescents in Western countries; that is, mainly living at home with families, not working, in school, and unmarried. In fact there are significant numbers of young people in the West who do not fit this description, but even larger groups within the developing countries. Perhaps the starkest difference is the context of sexual activity: whereas the vast majority of sexually active adolescent girls in the West are unmarried, in the developing countries the vast majority are married.

In dialogue with colleagues at UNICEF, UNFPA, and PATH, and with the financial support of the United Nations Foundation, we have created tables to more clearly describe the diversity of the adolescent experience by drawing on the rich Demographic and Health Survey data. These tables are descriptive. We have included small points of commentary where something is particularly striking. We offer them to you for reflection, as a basis for developing programs, and as a basis, indeed, for arguing for an enrichment of the research attention devoted to the many transitions that occur between the ages of 10 and 19.

In addition to highlighting, wherever we could, salient dimensions and experience (e.g., schooling, work, and marital status) by age, gender, urban/rural, and economic class groupings, we also draw attention to adolescents’ living arrangements and the

shape of their families. Earlier work conducted cooperatively between the Council's International Programs and Policy Research Divisions highlighted some very surprising—often counterintuitive—facts about the “family.” Whether adolescents live with one, both, or neither parent, and whether they live with and are responsible for their younger siblings, significantly shape their schooling, work, and migration status. With increasing levels of rural-to-urban migration, and the AIDS epidemic, families under stress may tend to transfer adult burdens to their oldest children—especially to girls. Adolescent girls may be required to leave school or work for wages, sometimes in unsafe ways and away from their homes.

Another often neglected dimension of the “adolescent problematique” is the contrast between the experience of married and unmarried adolescents. Very often the experiences of married and unmarried adolescents are considered together—for example, on issues such as their level of information about and use of contraceptives. We believe that married and unmarried adolescents represent significantly different populations. Although differences between the groups may vary by topic, the difference between them is the point. In treating the adolescent population as homogeneous, the profile and needs of married adolescents have very often been completely ignored. Married girls are plausibly the most vulnerable adolescents. Detached from a supportive peer group and from their natal or native home, often married by arrangement and facing a first pregnancy, married adolescent girls deserve our attention. The tabulations presented for some countries provide preliminary and rudimentary evidence that married adolescents are, if not at greater disadvantage than their unmarried counterparts, at least different, and we should plan for those differences.

This project will be ongoing. As data for additional countries and more recent data for the countries covered here become available, we will produce new sets of tables. And as we identify other tables of potential interest we will include them. We welcome your feedback and hope you find these tables useful.

Finally, we would like to acknowledge the significant creative and analytic efforts of our colleagues in producing these tables. We thank Brian Pence, Carey Meyers, Erica Chong, Christine Pace, and Roberta Scheinman for their intellectual contributions and hard work in this undertaking.

Technical Notes:

1. All tables in this report are calculated from data collected for the 1992 Namibia Demographic and Health Survey (DHS), conducted by the Ministry of Health and Social Services in Namibia and Macro International, Inc. The Namibia DHS surveyed a nationally representative sample of 4,101 households. The information presented in Tables 1-7 is based on all usual residents within the age group(s) of the selected households. The calculations for Tables 8-11 are based on 5,421 women between ages 15 and 49 who responded to a more detailed individual questionnaire. Data on awareness of HIV/AIDS, experience with sexually transmitted diseases, and female genital circumcision were not collected for Namibia.

More information on the design of and results from the 1992 Namibia DHS is provided in the final report (Katjuanja, Puumue, Stephen Titus, Maazuu Zauana, and J. Ties Boerma. 1993. *Namibia Demographic and Health Survey 1992*. Calverton, Maryland, USA: Ministry of Health and Social Services [Namibia] and Macro International, Inc.). More information on the Demographic and Health Surveys, including reports, other publications, and original data, is available on the DHS Web site at <http://www.measuredhs.com/>.

2. The tables report values for which data are available for the 1992 Namibia DHS. An X indicates that the information was not collected for that group in the 1992 survey.
3. Unless specifically designated as “percent distribution,” the cells represent percentages that do not sum to 100%. In most cases, the categories either are not mutually exclusive or do not exhaust the total population for the group. A guide to reading and interpreting the tables is included at the bottom of each page.
4. The measurement of economic status used to define the poorest 40%, middle 40%, and richest 20% of households in Tables 4-6 is based on a methodological approach discussed in Filmer, Deon and Lant Pritchett, 1999: “The Effect of Household Wealth on Educational Attainment: Evidence from 35 Countries,” *Population and Development Review*, vol. 25(1): 85-120. Derived from their work, indicators of household asset ownership (car, bicycle, television, etc.) and household characteristics (piped water, electricity, etc.) were used to create a single measure of economic status. Although the classification of economic status can be used for relative comparisons of socioeconomic groups within a country, comparisons of groups across countries are not appropriate.

A Summary of 1992 DHS Data on Adolescents in Namibia

Table 1. Urban-Rural Residence and Population Distribution

- Adolescents ages 10-19 comprise almost one-quarter of Namibia's population.
- Around three-quarters of Namibia's adolescents live in rural areas.
- Among both boys and girls, 15-19-year-olds are slightly more likely to live in urban areas than 10-14-year-olds.

Table 1. Urban-Rural Residence Distribution

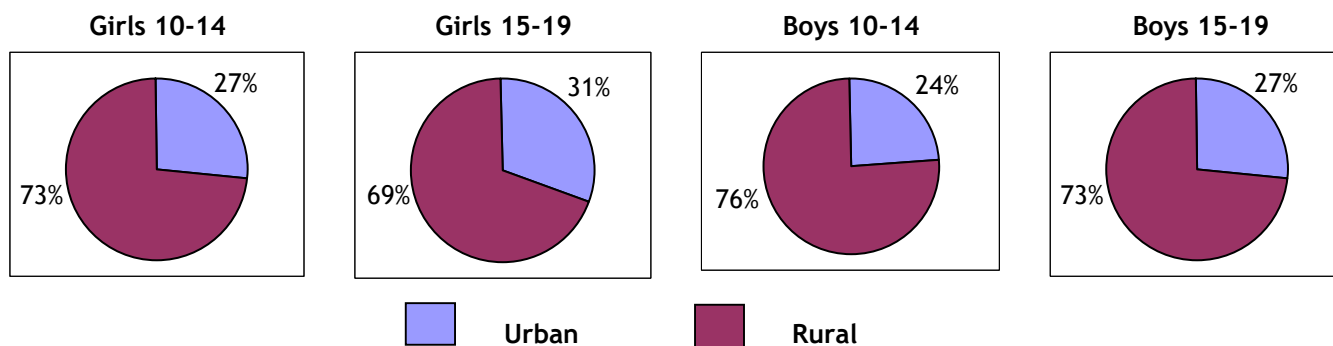

Table 2. Parental Survival Status and Residence in Household

- While more than four-fifths of adolescents 10-14 years old have both parents living, only about one-third live with both parents.
- Adolescents ages 10-14 living with one parent are three to four times more likely to live with only their mother than with only their father.
- Girls ages 10-14 are more likely to live in a household in which neither parent is present than in a household where both parents are present.

Table 2. Patterns of Parent/Child Co-residence

Table 3. Characteristics of Head of Household

- Almost one-third of 10-19-year-olds live in female-headed households.
- More than half of 10-14-year-olds live in households headed by someone other than a parent; this is more common among girls than boys.

Table 4. Educational Enrollment and Attainment

- The majority of adolescents in Namibia are enrolled in school.
- While girls 15-19 years old are less likely than boys in the same age group to be in school, they are more likely to have completed four or more years of school.
- Rates of completing four or more years of school have increased over the last ten years for girls, but decreased for boys.
- There is a positive relationship between economic status and educational attainment for both boys and girls.

Tables 5-7. Educational Enrollment and Attainment in Urban and Rural Areas

- Similar percentages of adolescents in rural and urban areas are enrolled in school. However, more urban adolescents than rural adolescents ages 15-19 are in secondary school (e.g., 44% of urban boys vs. 11% of rural boys).
- Urban adolescents are more likely to have completed four or more years of education than rural adolescents. Urban girls ages 15-19 are about twice as likely as rural girls in the same age group to have completed primary school.
- The positive correlation between economic status and educational attainment is similarly strong in rural and urban areas.

Tables 5 and 6. Educational Attainment

Urban youth 15-29 completing 4+ years of school

Rural youth 15-29 completing 4+ years of school

Girls
 Boys

Table 7. Educational Enrollment

Table 8. Marital Status

- Seven percent of girls ages 15-19 are currently married or in a cohabiting union.
- Early marriage is not common in Namibia; 11% of girls 20-24 years old were married by age 18 and 20% were married by age 20.
- There has been no change between the two age cohorts in the proportions of girls getting married by ages 15, 18, and 20.

Table 8. Age at Marriage

Table 9. Sexuality and Childbearing

- Forty-two percent of 15-19-year-old girls have ever had sexual intercourse, and 21% are sexually active.
- Four out of five sexually active girls ages 15-19 are not married.
- Sixty-three percent of ever-married girls and 14% of never-married girls ages 15-19 have had a child.

Table 10. Educational Enrollment and Work Status

- Among 15-19-year-olds, over 80% of unmarried girls without children are in school. In contrast, less than 7% of married girls are in school.
- Nearly three-quarters of 15-19-year-old married girls and girls with children are neither in school nor working.
- Around one-quarter of married girls ages 15-19 are working; married girls with children are the most likely group to be working.

Table 10. Educational Enrollment and Work Status of Girls 15-19 Years Old

Table 11. Awareness and Use of Modern Contraceptive Methods

- More than three-fourths of girls 15-19 years old have heard of a modern contraceptive method; ever-married girls are more likely than never-married girls to have heard of a modern method.
- Ever-married girls ages 15-19 are more than twice as likely as never-married girls in the same age group to have ever used a modern method (32% vs. 14%).
- Among the sexually active, 27% of never-married girls and 15% of ever-married girls are using a modern method of contraception.

Table 1
Urban-Rural Residence and Population Distribution

	Percent Distribution			Percent of Total Population
	Urban ^a	Rural ^a	Total	
Girls				
10-14	26.6	73.4	100.0	6.4
15-19	30.7	69.3	100.0	5.6
Boys				
10-14	24.1	75.9	100.0	5.7
15-19	26.8	73.2	100.0	5.5

^a Refer to the DHS report cited in the Technical Notes for the definitions used for urban and rural areas.

Guide to reading the table:

- In the first column of percentages (under “Urban”), read the first number as the percentage of girls 10-14 years old who live in urban areas.
- In the fourth column of percentages (under “Percent of Total Population”), read the first number as the percentage of the total population who are girls 10-14 years old.

Table 2
Parental Survival Status and Residence in Household
(Percent Distribution)

Parental Survival Status						
	Both Parents Alive	Father Alive, Mother Dead	Mother Alive, Father Dead	Neither Parent Alive	Total	
Girls						
10-14	86.9	2.3	9.8	1.0	100.0	
15-19	X	X	X	X	X	
Boys						
10-14	86.7	3.1	9.0	1.3	100.0	
15-19	X	X	X	X	X	
Parents Resident in Household^a						
	Both Parents in Household	Father Only in Household	Mother Only in Household	Neither Parent in Household	Total	
Girls						
10-14	30.1	5.5	23.3	41.0	100.0	
15-19	X	X	X	X	X	
Boys						
10-14	35.6	6.8	22.5	35.2	100.0	
15-19	X	X	X	X	X	

^a An adolescent is defined as not living with a parent if the parent is deceased or does not live in the household in which the adolescent resides.

Guide to reading the table:

- In the first column of percentages in the upper panel (under “Both Parents Alive”), read the first number as the percentage of girls 10-14 years old whose parents are living.
- In the first column of percentages in the lower panel (under “Both Parents in Household”), read the first number as the percentage of girls 10-14 years old who live in households where both parents reside.

Table 3
Characteristics of Head of Household^a
(Percent)

	Female Household Head	Non-Parent Household Head
Girls		
10-14	31.8	56.1
15-19	32.8	X
Boys		
10-14	31.0	50.8
15-19	30.0	X

^a The head of each household was identified by the member of that household responding to the household survey.

Guide to reading the table:

- In the first column of percentages (under “Female Household Head”), read the first number as the percentage of girls 10-14 years old who live in households with a female head.
- In the second column of percentages (under “Non-Parent Household Head”), read the first number as the percentage of girls 10-14 years old who live in households with someone other than their mother or father as head.

Table 4
Educational Enrollment and Attainment

Current Enrollment (Percent Distribution)						
	Not in School	In Primary^a	In Secondary^b	In Higher	Total	
Girls						
10-14	6.7	90.9	2.4	0.0	100.0	
15-19	30.7	44.5	24.8	0.1	100.0	
Boys						
10-14	8.5	89.8	1.8	0.0	100.0	
15-19	23.7	56.6	19.7	0.0	100.0	
Educational Attainment (Percent)						
	Completed 4+ Years		Completed Primary School			
Girls						
15-19	82.3		43.8 ^d			
20-24	84.7		60.6

Richest 20%	95.5		84.3			
Boys						
15-19	70.6		31.5 ^d			
20-24	76.9		50.0			
25-29	75.2		52.9			
Boys 15-29						
Poorest 40% ^c	64.5		26.5			
Middle 40%	72.5		40.4			
Richest 20%	91.9		74.7			

^a Primary school in Namibia consists of seven grades.

^b Secondary school in Namibia consists of five grades.

^c For an explanation of these categories, refer to the Technical Notes at the beginning of this document.

^d Because some 15-19-year-olds may still be attending primary school, caution should be used when comparing primary school completion rates of 15-19-year-olds to completion rates in older age groups or across countries.

Guide to reading the table:

- In the first column of percentages in the upper panel (under “Not in School”), read the first number as the percentage of girls 10-14 years old who are not currently enrolled in school.
- In the first column of percentages in the lower panel, read the fourth number (opposite “Poorest 40%”) as the percentage of girls 15-29 years old in the poorest 40% of households who have completed four or more years of formal education.

Table 5
Educational Enrollment and Attainment in Urban Areas^a

Current Enrollment (Percent Distribution)

15-19	43.7	11.1	0.0	0.0

^a Refer to the DHS report cited in the Technical Notes for the definitions used for urban and rural areas.

^b Primary school in Namibia consists of seven grades.

^c Secondary school in Namibia consists of five grades.

Guide to reading the table:

- In the first column of percentages in the upper panel (under “Not in School: Urban”), read the first number as the percentage of girls 10-14 years old living in urban areas who are not currently enrolled in school.
- In the second column of percentages in the upper panel (under “Not in School: Rural”), read the first number as the percentage of girls 10-14 years old living in rural areas who are not currently enrolled in school.

Table 8
Marital Status
(Percent Distribution)

	Never-Married	Currently Married or in Union ^a	Separated, Divorced, or Widowed	Total
Girls				
10-14	X	X	X	X
15-19	92.3	6.9	0.9	100.0
Boys				
10-14	X	X	X	X
15-19	X	X	X	X
	Married by Age 15 (Percent) ^b	Married by Age 18 (Percent) ^b	Married by Age 20 (Percent) ^b	Median Age at First Marriage (Years)
Girls				
20-24	1.6	11.4	20.1	X
25-29	2.0	11.2	20.3	X
Boys				
20-24	X	X	X	X
25-29	X	X	X	X

^a "In union" refers to girls who are in unions of cohabitation.

^b Defined as the percentage of girls in each age group who were married or in union by their 15th, 18th, or 20th birthday, respectively.

Guide to reading the table:

- In the first column of percentages in the upper panel (under "Never-Married"), read the second number as the percentage of girls 15-19 years old who have never been married.
- In the first column of percentages in the lower panel (under "Married by Age 15"), read the second number as the percentage of girls 25-29 years old who were married by their 15th birthday.

Table 9
Sexuality and Childbearing
(Percent)

	Ever Had Sexual Intercourse			Sexually Active ^a			Of Sexually Active, the Percent Married
	Of Never-Married	Of Total	Median Age at 1 st Sex (Years)	Of Unmarried ^b	Of Married ^c	Of Total	
Girls							
10-14	X	X	X	X	X	X	X
15-19	37.3	42.0	N/A ^d	17.6	65.1	20.9	21.3
Boys							
10-14	X	X	X	X	X	X	X
15-19	X	X	X	X	X	X	X
	Ever Pregnant ^e			Ever Had Child			
	Of Never-Married	Of Ever-Married ^f	Of Total	Of Never-Married	Of Ever-Married ^f	Of Total	
Girls							
10-14	X	X	X	X	X	X	
15-19	16.7	78.4	21.5	13.9	63.3	17.7	

^a“Sexually active” is defined as reporting having had sexual intercourse within the last 28 days.

^b“Unmarried” refers to girls who are currently neither married nor in unions of cohabitation. It includes those who are separated, divorced, or widowed.

^c“Married” refers to girls who are currently married or in unions of cohabitation.

^dOmitted because less than 50% in the age group first had sexual intercourse by age 15.

^eThe DHS collected information on past live births and current pregnancy status at the time of the interview. Information was not collected on miscarriages, stillbirths, or abortions, and hence is not included in the calculation of “ever pregnant.” This statistic, therefore, is likely to be an underestimate of the true percentage of girls who have ever been pregnant.

^f“Ever-married” refers to girls who are currently married, in union, separated, divorced, or widowed.

Guide to reading the table:

- In the first column of percentages in the upper panel (under “Ever Had Sexual Intercourse: Of Never-Married”), read the second number as the percentage of girls 15-19 years old who have had sexual intercourse among those who have never been married.
- In the seventh column of percentages in the upper panel (under “Of Sexually Active, the Percent Married”), read the second number as the percentage of girls 15-19 years old who are married, among those who report having had sex within the last 28 days.
- In the first column of percentages in the lower panel (under “Ever Pregnant: Of Never-Married”), read the second number as the percentage of girls 15-19 years old who have ever been pregnant, among those who have never been married.

Table 10
Educational Enrollment and Work^a Status^b
(Percent Distribution)

	Not in School, Not Working	In School Only	Working Only	In School and Working	Total
Unmarried^c, Without Children					
Girls					
10-14	X	X	X	X	X
15-19	13.3	77.7	3.5	5.6	100.0
Unmarried^c, With Children					
Girls					
10-14	X	X	X	X	X
15-19	70.4	12.7	16.9	0.0	100.0
Married^d, Without Children					
Girls					
10-14	X	X	X	X	X
15-19	70.5	7.1	22.4	0.0	100.0
Married^d, With Children					
Girls					
10-14	X	X	X	X	X
15-19	73.4	1.2	23.4	1.8	100.0

^a Work is defined as both formal and informal, and excludes housework. It includes activities that are paid in cash or in kind, as well as work for a family farm or business.

^b Information on work and parental status was not collected for boys.

^c "Unmarried" refers to girls who are currently neither married nor in unions of cohabitation. It includes those who are separated, divorced, or widowed.

^d "Married" refers to girls who are currently married or in unions of cohabitation.

Guide to reading the table:

- In the first column of percentages in the upper panel (under "Unmarried, Without Children: Not in School, Not Working"), read the second number as the percentage of unmarried girls 15-19 years old, without children, who are neither in school nor working.

Table 11
Awareness and Use of Modern Contraceptive Methods
(Percent)

	Heard of a Modern Method of Contraception^a	Ever Used a Modern Method	Of Sexually Active^b, Currently Using a Modern Method
Never-Married			
Girls			
10-14	X	X	X
15-19	76.7	13.7	27.1
Boys			
10-14	X	X	X
15-19	X	X	X
Ever-Married^c			
Girls			
10-14	X	X	X
15-19	89.4	32.0	15.0
Boys			
10-14	X	X	X
15-19	X	X	X

^a "Modern methods" of contraception include the oral contraceptive pill, intrauterine device, injections, diaphragm/foam/jelly, condom, female sterilization, male sterilization, and implants, including Norplant[®].

^b "Sexually active" is defined as reporting having had sexual intercourse within the last 28 days.

^c The term "ever-married" includes girls who are currently married, in union, separated, divorced, or widowed.

Guide to reading the table:

- In the first column of percentages (under "Heard of a Modern Method of Contraception: Never-Married"), read the second number as the percentage of girls 15-19 years old who have heard of a modern method of contraception, among those who have never been married.
- In the third column of percentages (under "Of Sexually Active, Currently Using a Modern Method: Never-Married"), read the second number as the percentage of never-married girls 15-19 years old who currently use a modern method of contraception, among those who report having had sexual intercourse within the last 28 days.
