Preface

Several years ago the Population Council produced special tabulations for 47 countries that provided a broad map of the living circumstances, schooling, marital status, reproductive health knowledge and behavior, and work experiences of adolescent boys and girls 10-19 years old. These tables drew on three Demographic and Health Survey sources: the household survey, the survey of girls and women of reproductive age, and, where available, parallel studies of boys and men of reproductive age. In these reports (entitled “Facts About Adolescents from the Demographic and Health Survey”), data on 10-14-year-olds are arrayed alongside data on 15-19-year-olds, which we believe is the ideal presentation of such data.

More recently, there has been a demand by program and policy audiences to separate out the relatively scarce data which exists on 10-14-year-olds from the 15-19-year-old cohort in an effort to make them user-friendly for program planning exercises. We have responded to this request by preparing separate data sheets which include the variables of the original tables in addition to several new ones. For example, special effort has been expended to explore the presence of 10-14-year-olds in potentially protective structures — families and schools — by cross-tabulating the presence of 10-14-year-olds in different kinds of living arrangements with school enrollment.

While early adolescence, for many, may be marked by relative good health and stable family circumstances, it can also be a period of vulnerability and intense transition. 10-14-year-olds progress from being clearly “children” at age 10, through the onset of puberty, to being perceived in some societies — in the case of girls — as “young women” ready for sexual relations, marriage, and childbearing, and — in the case of boys — as “young men” ready to help support their families and even serve in the military. Young adolescents are more likely than older adolescents to be in residence with parents and in school; however, their absence from school or lack of parental support (e.g., a surprisingly high proportion of 10-14-year-olds live with one or neither parent in many parts of sub-Saharan Africa) may be cause for concern. While some of these young people not residing with parents may be with their extended family, or in positive fostering or protective living arrangements, it is plausible that many are vulnerable to sexual exploitation, unsafe work, and substance abuse.

A new generation of research and interventions directed at the 10-14-year-old age group is urgently needed. Diagnostic work must define the key transitions and specify capacities, risks, and opportunities by age, gender, schooling, and marital status at the very least. The five-year cohort of 10-14-year-olds homogenizes too much of early adolescence and its rapid transitions. As research progresses, a more detailed picture of thresholds of change will emerge — it is possible that the fortunes of adolescents are determined not in five-year blocks, but rather in six-month, one-year, or three-year blocks, depending on the context. Collecting reliable data on young adolescents,
either from them or from intermediaries, is a considerable challenge. Some question the quality of data collected directly from very young adolescents, preferring to rely on retrospective reporting from older age cohorts. Moreover, there are important ethical considerations surrounding consent and parental permission to interview young people. Although we recognize and acknowledge these dilemmas, we contend that new data-gathering approaches, tools, and methodologies are warranted.

We must include questions concerning the social significance of puberty and how it shapes the ways in which young boys and girls think about themselves and how they are perceived by families and communities. Young people’s perceptions and experience of their sexuality and gender roles are also key subjects to explore. Finally, we must include questions surrounding marriage, as a decreasing but significant proportion of girls in some regions are married or are altering important life patterns — schooling, types of work, mobility — on the premise that they will marry by age 18. An early transition to marriage may make girls particularly vulnerable in settings where the HIV epidemic is underway and spousal age difference is high. We must learn more about the marriage process, including mate selection, extent of young people’s input, timing considerations, and the engagement period. Critical gaps remain in our knowledge of sexual consummation and expectations within early marriage, and the social and health impact of marriage on young people, particularly girls.1

The good news is that because of their age, young adolescents, even those in precarious circumstances, are resilient and flexible. Much can be done to remedy their situations before the architecture of their later life becomes set. Some of the young people we are most concerned about — those without parental support and not in school — may need to have their living situations stabilized before schooling, livelihoods or health interventions will be effective. To this end, creating safe spaces such as girls’ clubs, boys’ clubs, and hostels for street children may prove to be a lifeline.

In reviewing these data on very young adolescents, what we mainly know is that we don’t know very much. We urge caution in attributing more significance to these data than is warranted at this time and believe they are best understood in comparison to other age cohorts. Overall, we believe that efforts to supplement the DHS with other data sources are needed to get a broader picture of the lives of 10-14-year-olds. We hope that researchers will foster a new wave of quantitative and qualitative inquiry into the lives of this age group. And we further hope that their partners — policymakers and service providers — will draw on this information to develop a new generation of programs designed to protect and support adolescents, assisting them in making a safe and successful transition to adulthood.

Martha Brady, Judith Bruce, Erica Chong

1 The forthcoming National Academy of Sciences panel report on the transition to adulthood in developing countries explores many of these issues with cross-cultural data; it will be available from the Academy by the end of 2003. Currently available is an article on some of the marital dimensions of interest by Barbara Mensch, Susheela Singh, and John Casterline entitled “Trends in the timing of first marriage among men and women in the developing world.” (This paper was presented at the Population Association of America’s May 2003 meeting in Minneapolis.)
1. Urban-rural residence and population distribution

<table>

<tr>
<td>Girls</td>
<td>22.3</td>
</tr>
<tr>
<td>Boys</td>
<td>23.2</td>
</tr>
</tbody>
</table>

- More than three-quarters of adolescents 10-14 years old live in rural areas.
- 10-14-year-olds comprise 13% of Chad’s total population.

2. Parental survival status

- Nearly nine out of ten young adolescents have both parents living.

3. Parents resident in household (hh) by place of residence and sex

- Roughly half of urban adolescents and two-thirds of rural adolescents live with both parents.
- Adolescents 10-14 years old are more likely to live with only their mother than with only their father; this is especially true for girls.
- Nearly one-fourth of urban adolescents do not live with either parent.
4. Characteristics of household head

Note that if an adolescent has a non-parent household head, it cannot be inferred that a parent is or is not residing in the household. Similarly, if a female is household head, there may or may not be an adult male present in the household.

- Around one-quarter of 10-14-year-olds live in households headed by someone other than a parent.
- About one out of six young adolescents live in female-headed households; this is slightly more common among girls than boys.

5. Educational enrollment

- Boys are considerably more likely than girls to be enrolled in school.
- Urban adolescents are significantly more likely to be enrolled in school than rural adolescents.
- Almost four out of five rural girls 10-14 years old are not in school.

6. Distribution of girls and boys by living arrangements and school enrollment (percent)

</table>

This table maps the distribution of girls and boys by living arrangement and school enrollment, calculating what percentage of all girls or all boys each subgroup comprises.

- Seventy-one percent of all girls and 50% of boys are not in school.
- Girls living with neither parent who are not in school make up 13% of all girls 10-14 years old.
- Less than one out of five girls and one out of three boys are living with both parents and are enrolled in school.
7. Girls and boys not enrolled in school, by living arrangements (percent not enrolled)

- Adolescents 10-14 years old living with only their mother are the least likely group to be enrolled in school.
- Enrollment patterns are similar for boys and girls across all parental residence groupings.

8. Girls' retrospective reporting of age at first intercourse, marriage, and first birth

<table>
<thead>
<tr>
<th>Age group</th>
<th>% who had intercourse before age 15</th>
<th>% who married before age 15</th>
<th>% who gave birth before age 15</th>
</tr>

<td>34.8</td>
<td>36.4</td>
</tr>
</tbody>
</table>

- Eighty percent of 15-19-year-old girls who had sex before age 15 had sex in the context of marriage.
- While still high, the percentage of girls getting married before age 15 has decreased. Girls aged 15-19 were half as likely as girls aged 25-29 to be married by age 15.
- The percentage of girls giving birth before age 15 has dropped dramatically.

9. Media exposure, as measured by household ownership

- Only two percent of young adolescents live in a household that has a television, and 34% live in a household that has a radio.

Technical notes: All tables are calculated from data collected for the 1996-1997 Chad Demographic and Health Survey (DHS), conducted by the Bureau Central du Rencensement, Direction de la Statistique, des Études Économiques et Demographiques and Macro International, Inc. The Chad DHS surveyed a nationally representative sample of 6,840 households. The statistics presented in Tables 1-7 and 9 are based on information provided by a senior household member on 2,451 boys and 2,362 girls between ages 10 and 14. The calculations for Table 8 are based on an individual questionnaire that was applied to 15-19-year-olds (N=1,716), 20-24-year-olds (N=1,369), and 25-29-year-olds (N=1,349).
