Encourage Journalists to Cover Reproductive Health

After Egyptian print journalists attended a series of briefings on reproductive health issues, their reporting of these issues improved. Health agencies can improve coverage of reproductive health issues by providing a regular flow of accurate information to a broad range of journalists.

Background

To raise public awareness of reproductive health (RH) issues, the Population Council FRONTIERS project and the Futures Group POLICY project jointly organized press briefings and provided background materials to key journalists from Arabic newspapers and magazines. From May 1999 to June 2000, project staff worked closely with 20 Egyptian journalists, including editors of women’s pages and senior editors. The four press briefings covered youth, marriage patterns, contraceptive technology, and menopause. The press kit prepared for each briefing contained fact sheets, reference materials, a contact list of key experts, and an evaluation sheet.

To assess RH reporting and track coverage resulting from the intervention, project staff monitored eight major Arabic newspapers and nine magazines daily. All articles on RH were coded according to their topic, length, and use of research findings.

Findings

“The numbers and figures presented … will have a more effective impact on public opinion.” —Participating journalist

- Journalists attending the press briefings reported that their knowledge of RH issues increased and that they planned to use the press kits to write their articles. Some journalists shared the press kits with their colleagues.
The project did improve the quality of reporting, but room for further improvement remains. Roughly one in three articles based on the press briefings cited research findings or information included in the press kit. Although project staff stressed the need to use multiple sources, most articles were based on a single source of information.

Roughly one in three articles based on the press briefings cited research findings or information included in the press kit. Although project staff stressed the need to use multiple sources, most articles were based on a single source of information.

The majority of RH newspaper articles were news stories. In contrast, more than half of the magazine articles were feature stories; half of these articles were one page or longer. Both media formats are useful for research dissemination: newspapers are widely read by policymakers, while magazines tend to be shared with others and retained for a long time.

Policy Implications

- Research dissemination should include briefings and resource materials for journalists. Links with both print and broadcast journalists should be developed.
- To broaden the range of RH topics presented, more local agencies should be involved in media relations activities. More information about family planning and female genital cutting* should be provided to journalists, since these topics currently receive little press coverage.
- Health agencies should seek to improve the quality of reporting by providing a regular flow of accurate information and helping journalists to identify newsworthy stories.
